From GRAVITY to GRAVITY+

“The mission of GRAVITY+ is to implement faint, all sky, high contrast, milli-arcsecond imaging at the VLT”
(consortium MoU, Feb. 2020)

- Reach full sky coverage in Galactic Plane and 10% in Galactic Poles
 - => install LGS on all UTs
 - => conclude installation of dual-beam
- Open high contrast (then shorter wavelength, nulling)
 - => high order AO
 - => vibration tracking
- Rejuvenate VLTI for the next 20years, deal with several obsolescence.

From GRAVITY to GRAVITY+

“The mission of GRAVITY+ is to implement faint, all sky, high contrast, milli-arcsecond imaging at the VLTI”
(consortium MoU, Feb. 2020)

- Reach full sky coverage in Galactic Plane and 10% in Galactic Poles
 - => install LGS on all UTs
 - => conclude installation of dual-beam
- Open high contrast (then shorter wavelength, nulling)
 - => high order AO
 - => vibration tracking
- Rejuvenate VLTI for the next 20 years, deal with several obsolescence.

New Science

- Measure AGN mass and gas dynamics up to epoch of peak galaxy formation at $z \sim 1 - 3$. Together with reverberation: independent measurement of the Hubble constant.
*Improved throughput
All sky*
- Orbit of faint and/or yet-unknown stars around Sgr A*, astrometry and polarimetry of SgrA* flares
*Better AO
Improved throughput*
- Obtain high-quality spectra and orbits of exoplanets, closer and deeper. Characterise Gaia exoplanets.
*High Contrast xAO
Improved throughput*
- Study accretion-ejection in large samples of HMXB, LMXB, and YSO, instead of handful of objects. Observe flares and transient.
*Improved throughput
All sky*
- Establish whether star clusters and globular clusters harbor (the elusive) intermediate mass black holes.
*Improved throughput
All sky*

Top Level Requirements

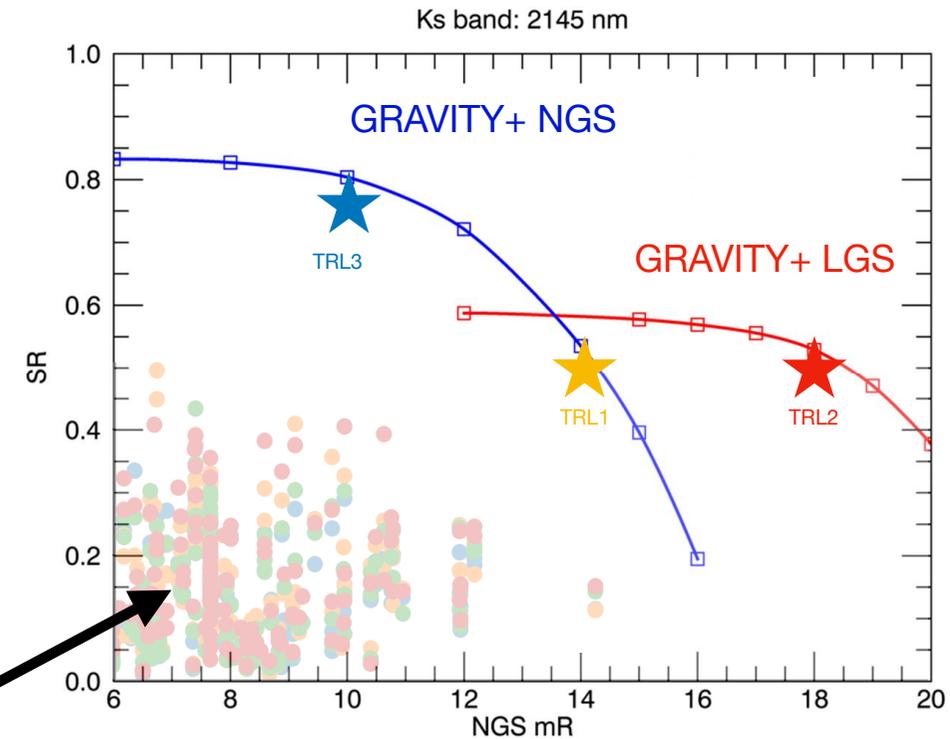

Table 1: Top-level performance specifications for GRAVITY+, the acronyms are given in appendix 1.

	Science case	AO mode	FT mode	AO star R mag	SR* in K-band	FT star K mag	FT rms OPD for K = 10	SC-FT distance	SC star K mag*
1	Galactic Center	LGS	off-axis	14	> 50%	10	< 100 nm	Up to 30"	22
2	Extragalactic, faint galactic	LGS / NGS	on/off-axis	18 (LGS) 10 (NGS)	> 50%	13 (goal 15)	< 100 nm	Limited by STS **	22
3	Exoplanet & high contrast	NGS	on-axis	10	> 75%	10	< 100 nm	Limited by GRAVITY ***	22

* When operating close to the guide-star. For off-axis operation, the performance will be reduced by atmospheric anisoplanatism.

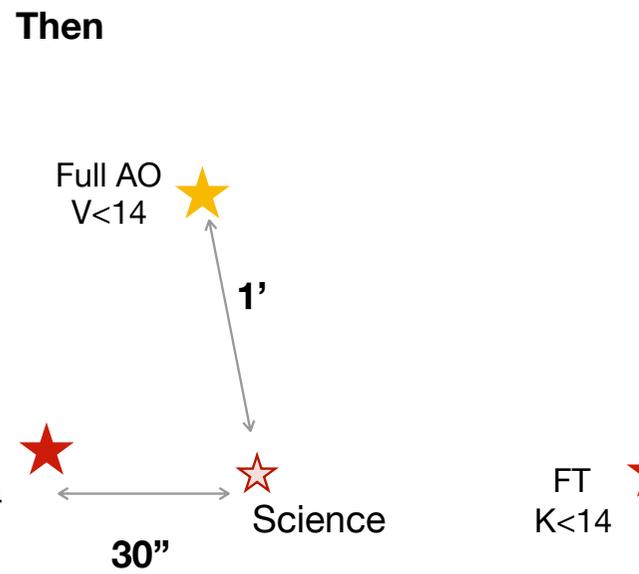

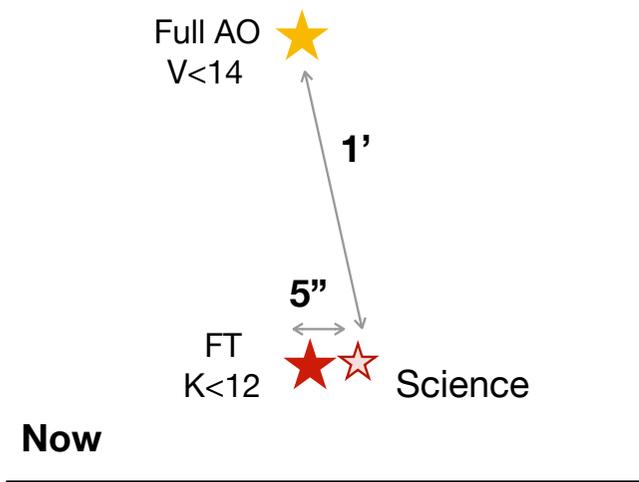

** The available patrol field of the current PRIMA STS is about 1' radius

*** Separation between exoplanet and host star limited by GRAVITY dual field FoV of 2" UT

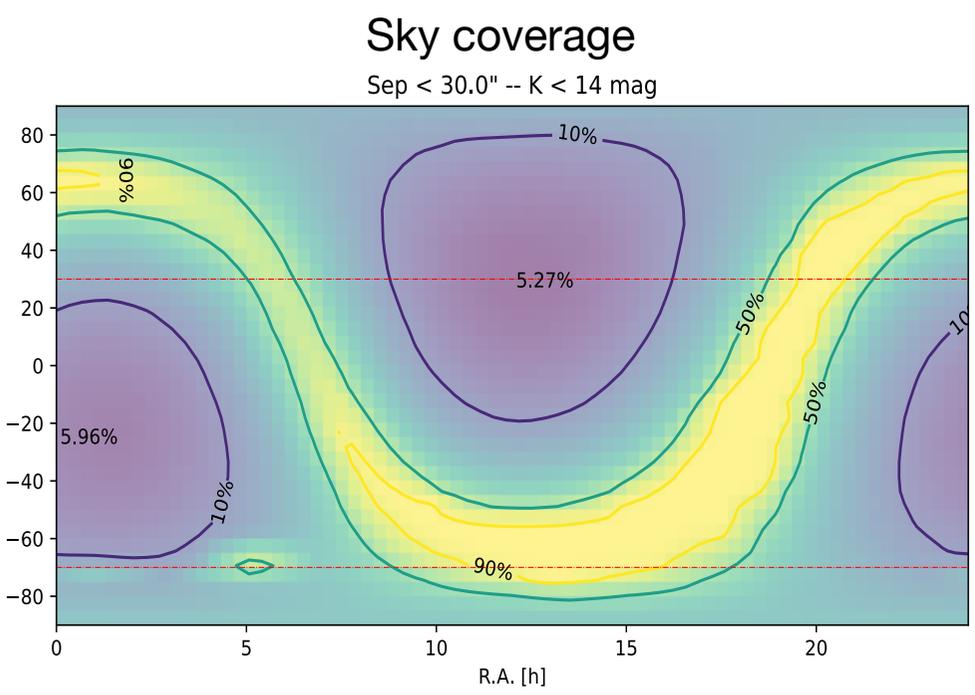

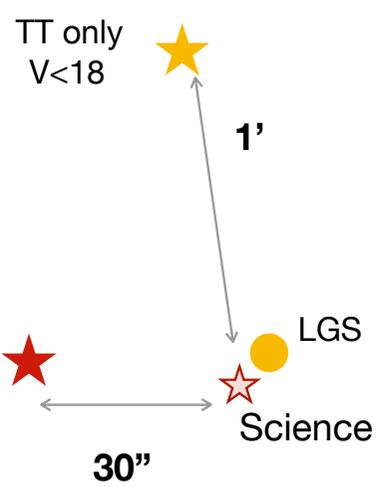

Current MACAO

Few thoughts on JMMC / GRAVITY+

- Most JMMC efforts related to GRAVITY are relevant for GRAVITY+
- Aspro2, SearchCal, OiFitsExp are the most used and recognized tools by GRAVITY users/ consortium.
- Preparation of observation for faint objects will be a big deal
 - Need to search for 2 reference stars
 - Need to compare LGS / NGS modes
- Pipeline still under leadership of consortium. Possible evolutions are still being explored by experts.

Ideas ?

- Work on Aspro2 noise model including the basic effect of AO with on/off-axis and lgs/ngs modes ?
- Think of a way to search AO/FT references sources around science coordinates ?
- OiFits explorer basics (e.g click to discard point, make the top-left browser usefull...)

Planning

In short:

- The project is on a “success oriented” schedule.
- On-track so far.
- Dual-field observations start now, but LGS arrive 2025
